SECTION 01:

WEB SCRAPPING

Section 01:

Step 01:

First of all, we took three websites of three different universities as it was given in the instructions. All of them contained the noun "quality". In section 1 we had to do web scrapping to extract the data to have a comparison study among the different websites. In the comparative study we took in consideration nouns, adjectives, and verbs.

```
from website1 import *
from website2 import *
from website3 import *
#Now i need access to the data of the website...
#print (first_website_total[0])
from matplotlib import pyplot
import numpy as np

# first_website_total,second_website_total & third_website_total
# 0 index contains the total number of Nouns
# 1 index contains total number of Verbs
# 2 Index contains total number of Ajection

# THIS Function takes 3 values and show the Graph with label for comparison
def comparison_graph_display(first_pof,second_pof,third_pof,labels):
    X = ["FAST","NUST","LUMS"]
    nouns = [first_pof,second_pof,third_pof]
    X_axis = np.arange(len(X))
    pyplot.bar(X_axis + 0.0, nouns, 0.4, label = labels)
    pyplot.xticks(X_axis, X)
    pyplot.xlabel(labels)
    pyplot.ylabel("Counting")
    pyplot.title("Comparison of Three Websites " + labels)
    pyplot.legend()
    pyplot.show()

# 0 index contains the total number of Nouns
# 1 index contains total number of Verbs
# 2 Index contains total number of Ajection
comparison_graph_display(first_website_total[0],second_website_total[0],third_website_total[0],"Nouns")
comparison_graph_display(first_website_total[1],second_website_total[1],third_website_total[1],"Verbs")
comparison_graph_display(first_website_total[2],second_website_total[2],third_website_total[2],"Adjective")
```

When all of the text from the different websites was extracted then we moved on to the next step of extracting the nouns, adjectives, and verbs.

. hrs.TitleCr. hrs.Philosophy of Management Science3Quantitative Methods in Management Research 3Research and Theory in
Management3Qualitative Methods in Management Research3Note: Deficiency courses may be recommended by FSM-DAC for selecte
d candidates on case to case basis.Outlines of Core Courses (These are broad guidelines only. Instructors may vary empha
ses on individual topics and themes and bring additional topics that they see fit)Philosophy of Management Science (MG60
1): It is said that management is governing and leading without recourse to political power or religious authority. This
advanced level course will help students to realize and appreciate the nature of management field to a greater maturity
and sophistication by interchangeably addressing the philosophical aspects of management and managerial aspects of phil
osophy. Accordingly, the process that will be used will start with, and put major focus on, developing an understanding
of the evolution of management and organizational philosophy in a chronological order by classifying the work of central
theorists and authors from a perspective that clarifies their relevance with the mainstream theory building in the fiel
d of management. The idea is to dissect the body of knowledge in management science \xe2\x80\x93 i.e., perspectives such
as classical and neo-classical organization theory, OB perspective, structural organization theory, systems theory and
organizational economics, power and politics, organizational culture and environment, and postmodernism, etc. \xe2\x80\x
93 and interpret it as a continuous effort to analyzing, predicting, controlling and governing human action.Research and
Theory in Management (MG604): A theory is said to be an ordered set of assertions about a generic set of behavior that
hold true for a wide range of specific instances. But where do new theories come from? How theories are built starting f
rom a very basic research question? And can theories be good or bad since once popularized they not only explain behavio
r but influence behavior in a certain direction. Finally, what constitutes a \xe2\x80\x93weak\xe2\x80\x93 or a \xe2\x80\x
93strong\xe2\x80\x93 theory? The aim of this course is to develop a critical appreciation of the role of research in the
ory development in Management as well as introducing doctoral students to the art and science of theory construction and
model building. Topics include examining the nature of being (ontology) and knowing (epistemology), exploring the basic
structure of argument and evidence, developing a pertinent and interesting research question, defining constructs, imag
ining relationships and processes that link constructs, and linking and combining constructs in an innovative way to dev
elop new theories or build further upon existing behavioral models. This course demands intensive preparation on part of
students in terms of readings prior to the lectures so that lively discussions can be generated in the classroom, rese
arch exercises tailored to each student\xe2\x80\x93s research topic can be accomplished, and a term paper be completed.Qu
alitative Methods (MG 589): This course will introduce a range of qualitative research methods and the means of assessin
g the key assumptions underlying the selection and use these methods. Building on the fundamental questions about the na
ture of knowledge and whether "true" knowledge or reality can exist, the discussions will provide a deep understanding o
f the advantages and challenges in carrying out qualitative research. Examples of topics covered include interviews, foc
us groups, ethnography, documentary and textual analysis, discourse analysis, language and conversation analysis, case-s
tudies, participatory action research and grounded theory. Categorization and coding of data will be covered in detail.
The course will include labs to introduce software for qualitative data analysis. The course will also cover the growing
significance of qualitative research techniques across the modern and postmodern era. Further, scholars will be encoura
ged to analyze and understand various approaches to writing qualitative papers.Quantitative Methods (MG 548): This cours
e will introduce a range of advance quantitative research technique and develop an understanding of the potential and li
mitations of statistical analysis. Building on the positivist paradigm, the course will briefly revise concepts of proba
bility, sampling, hypothesis development, developing constructs, associations and basic analyses for differences between
groups. Examples of main topics covered include various types of regression, discriminant analysis, MANOVA, analysis of
covariance, principal component and factor analysis, cluster analysis, structural equation modelling, survival/failure
analysis and time series analysis. The course will include labs to introduce software for quantitative data analysis. Sc
holars will be encouraged to analyze and understand articles which have used a variety of quantitative methods, developi
ng the capacity to choose advance techniques suitable for their research questions. More Details PhD (Software Engineeri

**COMPARISON OF VERBS,
ADJECTIVES AND NOUNS
AMONG THE THREE WEBSITES**

COMPARISON

Comparison of nouns:

From the noun comparison bar chart, we can see that the total number of nouns for all the websites were plotted in the chart. The 5 web pages that were selected from each website contained many nouns. So, the number of nouns (7271) in LUMS university website are more than NUST and FAST university website. NUST university website contained the least number of nouns.

Comparison of verbs:

When we compared verbs from all three website, we still can see that LUMS had the highest number of verbs (2601) as compared to the rest two university websites.

Comparison of Adjectives:

When we compared adjectives from all three website, we still can see that LUMS had the highest number of adjectives (1314) as compared to the rest two university websites.

Data from all three websites:
